### Recap: Single Parameter Bayesian Inference

- Bayesian Inference Procedure:
  - Name a prior
  - ► Get the posterior (proportional notation)
  - ▶ Point estimators: MAP, posterior mean, etc..
  - Credible interval: QBI, HDR.
  - Prediction for new observations.

## Recap: Single Parameter Bayesian Inference

- Bayesian Inference Procedure:
  - Name a prior
  - Get the posterior (proportional notation)
  - Point estimators: MAP, posterior mean, etc..
  - Credible interval: QBI, HDR.
  - Prediction for new observations.
- Prior Elicitation:
  - Conjugate Prior
  - Uninformative Prior / Jeffreys Prior
  - (Improper Prior Distribution)

### Recap: Single Parameter Bayesian Inference

- Bayesian Inference Procedure:
  - Name a prior
  - ► Get the posterior (proportional notation)
  - Point estimators: MAP, posterior mean, etc..
  - Credible interval: QBI, HDR.
  - Prediction for new observations.
- Prior Elicitation:
  - Conjugate Prior
  - Uninformative Prior / Jeffreys Prior
  - (Improper Prior Distribution)
- Important Examples:
  - Normal with known variance:  $p(\theta) \propto 1$  (conj. prior: Normal)
  - Normal with known mean:  $p(\sigma^2) \propto (\sigma^2)^{-1}$  (conj. prior: inv-Gamma)

▶ Nuisance parameters are parameters that are unknown and of no interest.

- Nuisance parameters are parameters that are unknown and of no interest.
- ▶ Suppose the unknown parameter is  $\theta = (\theta_1, \theta_2)$ .
- ► A well-defined observation model gives

$$y \mid \theta_1, \theta_2$$

- ▶ A Bayesian inference needs to define a prior for both  $\theta_1$  and  $\theta_2$ :  $p(\theta_1, \theta_2)$
- ► Then the **joint** posterior is obtained by

$$p(\theta_1, \theta_2 \mid y) \propto p(\theta_1, \theta_2) p(y \mid \theta_1, \theta_2)$$

- Nuisance parameters are parameters that are unknown and of no interest.
- ▶ Suppose the unknown parameter is  $\theta = (\theta_1, \theta_2)$ .
- ► A well-defined observation model gives

$$y \mid \theta_1, \theta_2$$

- ▶ A Bayesian inference needs to define a prior for both  $\theta_1$  and  $\theta_2$ :  $p(\theta_1, \theta_2)$
- ► Then the **joint** posterior is obtained by

$$p(\theta_1, \theta_2 \mid y) \propto p(\theta_1, \theta_2) p(y \mid \theta_1, \theta_2)$$

▶ If we are only interested in  $\theta_1$ , we need to get the **marginal** posterior for  $\theta_1$ :

$$p(\theta_1 \mid y) = \int p(\theta_1, \theta_2 \mid y) d\mu(\theta_2)$$

▶ An important observation for the marginal posterior is

$$p(\theta_1 \mid y) \propto \int p(\theta_1 \mid \theta_2, y) p(\theta_2 \mid y) d\mu(\theta_2)$$

▶ An important observation for the marginal posterior is

$$p(\theta_1 \mid y) \propto \int p(\theta_1 \mid \theta_2, y) p(\theta_2 \mid y) d\mu(\theta_2)$$

- First observation:
  - ln order to draw samples from  $p(\theta_1 \mid y)$
  - We may first draw  $\theta_2$  from  $p(\theta_2 \mid y)$  (if it is much easier)
  - ▶ Then draw  $\theta_1$  from  $p(\theta_1 \mid \theta_2, y)$  with  $\theta_2$  drawn in the first step.

▶ An important observation for the marginal posterior is

$$p(\theta_1 \mid y) \propto \int p(\theta_1 \mid \theta_2, y) p(\theta_2 \mid y) d\mu(\theta_2)$$

- First observation:
  - ▶ In order to draw samples from  $p(\theta_1 \mid y)$
  - We may first draw  $\theta_2$  from  $p(\theta_2 \mid y)$  (if it is much easier)
  - ▶ Then draw  $\theta_1$  from  $p(\theta_1 | \theta_2, y)$  with  $\theta_2$  drawn in the first step.
- Second observation:
  - In order to construct a conjugate joint prior
  - We may find a conjugate prior for the conditional observation model:

$$p(y \mid \theta_1, \theta_2)$$

with fixed  $\theta_2$ 

► Then find a conjugate prior for the marginal observation model:

$$p(y \mid \theta_2) = \int p(y \mid \theta_1, \theta_2) p(\theta_1 \mid \theta_2) d\mu(\theta_1)$$

► Suppose we observe

$$y_1, \ldots, y_n \sim \mathcal{N}(\mu, \sigma^2), \quad i.i.d.$$

with unknown  $\mu$  and  $\sigma^2$ .

Suppose we observe

$$y_1, \ldots, y_n \sim \mathcal{N}(\mu, \sigma^2), \quad i.i.d.$$

with unknown  $\mu$  and  $\sigma^2$ .

▶ The observation model is

$$p(y_1, \dots, y_n \mid \mu, \sigma^2) \propto \prod_{i=1}^n \frac{1}{\sqrt{\sigma^2}} \exp\left\{-\frac{(y_i - \mu)^2}{2\sigma^2}\right\} = (\sigma^2)^{-n/2} \exp\left\{-\frac{\sum_{i=1}^n (y_i - \mu)^2}{2\sigma^2}\right\}$$

► Suppose we observe

$$y_1, \ldots, y_n \sim \mathcal{N}(\mu, \sigma^2), \quad i.i.d.$$

with unknown  $\mu$  and  $\sigma^2$ .

▶ The observation model is

$$p(y_1, \dots, y_n \mid \mu, \sigma^2) \propto \prod_{i=1}^n \frac{1}{\sqrt{\sigma^2}} \exp\left\{-\frac{(y_i - \mu)^2}{2\sigma^2}\right\} = (\sigma^2)^{-n/2} \exp\left\{-\frac{\sum_{i=1}^n (y_i - \mu)^2}{2\sigma^2}\right\}$$

Notice that

$$\sum_{i=1}^{n} (y_i - \mu)^2 = \sum_{i=1}^{n} (y_i - \bar{y})^2 + n(\bar{y} - \mu)^2$$

Suppose we observe

$$y_1, \ldots, y_n \sim \mathcal{N}(\mu, \sigma^2), \quad i.i.d.$$

with unknown  $\mu$  and  $\sigma^2$ .

► The observation model is

$$p(y_1, \dots, y_n \mid \mu, \sigma^2) \propto \prod_{i=1}^n \frac{1}{\sqrt{\sigma^2}} \exp\left\{-\frac{(y_i - \mu)^2}{2\sigma^2}\right\} = (\sigma^2)^{-n/2} \exp\left\{-\frac{\sum_{i=1}^n (y_i - \mu)^2}{2\sigma^2}\right\}$$

Notice that

$$\sum_{i=1}^{n} (y_i - \mu)^2 = \sum_{i=1}^{n} (y_i - \bar{y})^2 + n(\bar{y} - \mu)^2$$

▶ Therefore, we write (with  $s^2 = (n-1)^{-1} \sum_i (y_i - \bar{y})^2$  the sample variance)

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

▶ The score function is

$$\nabla \ell(\mu, \sigma^2) = \begin{pmatrix} -\frac{n(\mu - \bar{y})}{\sigma^2} \\ \frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2(\sigma^2)^2} - \frac{n}{2\sigma^2} \end{pmatrix}$$

▶ The Fisher's information  $(2 \times 2 \text{ matrix})$  is

$$\mathcal{I}(\mu, \sigma^2) = -\mathbb{E}_{\mu, \sigma^2}[\Delta \ell(\mu, \sigma)] = \begin{bmatrix} \frac{n}{\sigma^2} & 0\\ 0 & \frac{n}{2\sigma^4} \end{bmatrix}$$

▶ The estimations of  $\mu$  and of  $\sigma^2$  are independent.

- Attemp 1:
  - $\triangleright$  Since estimating  $\mu$  and  $\sigma^2$  are independent, recall the Uninformative prior:

Normal with Known Variance 
$$:p(\mu) \propto 1$$
  
Normal with Known Mean  $:p(\sigma^2) \propto 1/\sigma^2$ 

By independence, we construct the following joint prior:

$$p(\mu, \sigma^2) \propto 1/\sigma^2$$

▶ The above prior is uniform in  $(\mu, \log \sigma^2)$ .

- Attemp 1:
  - $\triangleright$  Since estimating  $\mu$  and  $\sigma^2$  are independent, recall the Uninformative prior:

Normal with Known Variance 
$$:p(\mu) \propto 1$$
  
Normal with Known Mean  $:p(\sigma^2) \propto 1/\sigma^2$ 

By independence, we construct the following joint prior:

$$p(\mu, \sigma^2) \propto 1/\sigma^2$$

- ▶ The above prior is uniform in  $(\mu, \log \sigma^2)$ .
- Attemp 2:
  - With Jeffreys prior, we define the prior using the Fisher's information by

$$p(\mu, \sigma^2) \propto \sqrt{|\mathcal{I}|} \propto 1/\sigma^3$$

▶ The prior is uniform in  $(\mu/\sigma, \log \sigma^2)$ .

- Attemp 1:
  - $\triangleright$  Since estimating  $\mu$  and  $\sigma^2$  are independent, recall the Uninformative prior:

Normal with Known Variance 
$$:p(\mu) \propto 1$$
  
Normal with Known Mean  $:p(\sigma^2) \propto 1/\sigma^2$ 

By independence, we construct the following joint prior:

$$p(\mu, \sigma^2) \propto 1/\sigma^2$$

- ▶ The above prior is uniform in  $(\mu, \log \sigma^2)$ .
- Attemp 2:
  - With Jeffreys prior, we define the prior using the Fisher's information by

$$p(\mu, \sigma^2) \propto \sqrt{|\mathcal{I}|} \propto 1/\sigma^3$$

- ▶ The prior is uniform in  $(\mu/\sigma, \log \sigma^2)$ .
- Only the second one is uninformative.

#### Uninformative Prior

▶ Jeffreys prior for multiparameter case:

$$p(\theta_1,\ldots,\theta_k) \propto \sqrt{|\mathcal{I}(\theta_1,\ldots,\theta_k)|}$$

#### Uninformative Prior

▶ Jeffreys prior for multiparameter case:

$$p(\theta_1, \dots, \theta_k) \propto \sqrt{|\mathcal{I}(\theta_1, \dots, \theta_k)|}$$

- Reasoning:
  - ▶ We assign uniform prior  $p(\theta) \propto 1$  for the case that

$$\mathcal{I}( heta) \propto m{I}$$

 $\blacktriangleright$  For any bijective continous mapping  $\lambda=g(\theta),$  we have

$$\mathcal{I}(\lambda) = \left(\frac{\partial \theta}{\partial \lambda}\right)^T \mathcal{I}(\theta) \left(\frac{\partial \theta}{\partial \lambda}\right)$$

▶ This corresponds to the change-of-variable of  $p(\theta)$  to  $\lambda$ :

$$p(\lambda) = p(\theta) \left| \frac{\partial \theta}{\partial \lambda} \right| \propto \sqrt{|\mathcal{I}(\lambda)|}$$

► Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

Now we choose the Jeffreys prior as  $p(\mu, \sigma^2) \propto 1/\sigma^3$ .

► Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

- Now we choose the Jeffreys prior as  $p(\mu, \sigma^2) \propto 1/\sigma^3$ .
- ► The joint posterior is

$$p(\mu, \sigma^2 \mid y_1, \dots, y_n) \propto (\sigma^2)^{-(n+3)/2} \exp\left\{-\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2}\right\}$$

► Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

- Now we choose the Jeffreys prior as  $p(\mu, \sigma^2) \propto 1/\sigma^3$ .
- ► The joint posterior is

$$p(\mu, \sigma^2 \mid y_1, \dots, y_n) \propto (\sigma^2)^{-(n+3)/2} \exp\left\{-\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2}\right\}$$

ightharpoonup The conditional posterior for  $\mu$  is

$$p(\mu \mid \sigma^2, y_1, \dots, y_n) \sim \mathcal{N}(\bar{y}, \sigma^2/n)$$

▶ Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

- Now we choose the Jeffreys prior as  $p(\mu, \sigma^2) \propto 1/\sigma^3$ .
- ► The joint posterior is

$$p(\mu, \sigma^2 \mid y_1, \dots, y_n) \propto (\sigma^2)^{-(n+3)/2} \exp\left\{-\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2}\right\}$$

 $\blacktriangleright$  The conditional posterior for  $\mu$  is

$$p(\mu \mid \sigma^2, y_1, \dots, y_n) \sim \mathcal{N}(\bar{y}, \sigma^2/n)$$

▶ The conditional posterior for  $\sigma^2$  is

$$p(\sigma^2 \mid \mu, y_1, \dots, y_n) \sim \mathsf{Inv-Gamma}((n+1)/2, [(n-1)s^2 + n(\bar{y}-\mu)^2]/2)$$

▶ The marginal posterior for  $\sigma^2$ :

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \int p(\mu, \sigma^2 \mid y_1, \dots, y_n) d\mu \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

▶ The marginal posterior for  $\sigma^2$ :

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \int p(\mu, \sigma^2 \mid y_1, \dots, y_n) d\mu \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

Or we can take

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \frac{p(\mu, \sigma^2 \mid y_1, \dots, y_n)}{p(\mu \mid \sigma^2 y_1, \dots, y_n)} \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

▶ The marginal posterior for  $\sigma^2$ :

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \int p(\mu, \sigma^2 \mid y_1, \dots, y_n) d\mu \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

Or we can take

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \frac{p(\mu, \sigma^2 \mid y_1, \dots, y_n)}{p(\mu \mid \sigma^2 y_1, \dots, y_n)} \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

▶ Therefore,  $p(\sigma^2 \mid y_1, \dots, y_n) \sim \text{InvGamma}(n/2, (n-1)s^2/2) \sim \text{Scaled-Inv-}\chi^2(n, s^2)$ 

▶ The marginal posterior for  $\sigma^2$ :

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \int p(\mu, \sigma^2 \mid y_1, \dots, y_n) d\mu \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

Or we can take

$$p(\sigma^2 \mid y_1, \dots, y_n) \propto \frac{p(\mu, \sigma^2 \mid y_1, \dots, y_n)}{p(\mu \mid \sigma^2 y_1, \dots, y_n)} \propto (\sigma^2)^{-(n+2)/2} \exp\left\{-\frac{(n-1)s^2}{2\sigma^2}\right\}$$

- Therefore,  $p(\sigma^2 \mid y_1, \dots, y_n) \sim \text{InvGamma}(n/2, (n-1)s^2/2) \sim \text{Scaled-Inv-}\chi^2(n, s^2)$
- ► The densities:

InvGamma
$$(\alpha, \beta) \propto x^{-\alpha-1}e^{-\beta/x}$$
, Scaled-Inv- $\chi^2(\nu, \tau^2) \propto x^{-\nu/2-1}e^{-\nu\tau^2/(2x)}$ 

▶ The marginal posterior for  $\mu$  is:

$$p(\mu \mid y_1, \dots, y_n) \propto \frac{p(\mu, \sigma^2 \mid y_1, \dots, y_n)}{p(\sigma^2 \mid \mu^2, y_1, \dots, y_n)}$$
$$\propto \left[ (n-1)s^2 + n(\bar{y} - \mu)^2 \right]^{-(n+1)/2}$$
$$\propto \left[ 1 + \frac{n(\bar{y} - \mu)^2}{(n-1)s^2} \right]^{-(n+1)/2}$$

▶ The marginal posterior for  $\mu$  is:

$$p(\mu \mid y_1, \dots, y_n) \propto \frac{p(\mu, \sigma^2 \mid y_1, \dots, y_n)}{p(\sigma^2 \mid \mu^2, y_1, \dots, y_n)}$$
$$\propto \left[ (n-1)s^2 + n(\bar{y} - \mu)^2 \right]^{-(n+1)/2}$$
$$\propto \left[ 1 + \frac{n(\bar{y} - \mu)^2}{(n-1)s^2} \right]^{-(n+1)/2}$$

▶ It follows a noncentral scaled t distribution  $t_n(\bar{y}, (n-1)s^2/n^2)$ .

▶ The marginal posterior for  $\mu$  is:

$$p(\mu \mid y_1, \dots, y_n) \propto \frac{p(\mu, \sigma^2 \mid y_1, \dots, y_n)}{p(\sigma^2 \mid \mu^2, y_1, \dots, y_n)}$$
$$\propto \left[ (n-1)s^2 + n(\bar{y} - \mu)^2 \right]^{-(n+1)/2}$$
$$\propto \left[ 1 + \frac{n(\bar{y} - \mu)^2}{(n-1)s^2} \right]^{-(n+1)/2}$$

- ▶ It follows a noncentral scaled t distribution  $t_n(\bar{y}, (n-1)s^2/n^2)$ .
- ► The kernel:

$$t_{\nu}(\mu, \tau^2) \propto \left[ 1 + \frac{(x-\mu)^2}{\nu \tau^2} \right]^{-(\nu+1)/2}$$

Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

▶ We need some prior is the following form:

$$p(\mu, \sigma^2) \propto (\sigma^2)^{-\alpha} \exp\left\{-\frac{\beta + \gamma(\mu - \delta)^2}{2\sigma^2}\right\}$$

for some hyperparameters  $(\alpha, \beta, \gamma, \delta)$ .

Recall the observation model:

$$p(y_1, ..., y_n \mid \mu, \sigma^2) \propto (\sigma^2)^{-n/2} \exp \left\{ -\frac{(n-1)s^2 + n(\bar{y} - \mu)^2}{2\sigma^2} \right\}$$

We need some prior is the following form:

$$p(\mu, \sigma^2) \propto (\sigma^2)^{-\alpha} \exp\left\{-\frac{\beta + \gamma(\mu - \delta)^2}{2\sigma^2}\right\}$$

for some hyperparameters  $(\alpha, \beta, \gamma, \delta)$ .

- We observe:
  - $\mu \mid \sigma^2 \sim \mathcal{N}(\delta, \sigma^2/\gamma)$
  - $\sigma^2 \mid \mu \sim \text{InvGamma}(\alpha 1, (\beta + \gamma(\mu \delta)^2)/2)$
  - $ightharpoonup \sigma^2 \sim {\sf InvGamma}(\alpha 3/2, \beta/2)$

▶ We found the following combination most convenient:

$$\sigma^2 \sim \text{InvGamma}, \quad \mu \mid \sigma^2 \sim \text{Normal}$$

▶ We found the following combination most convenient:

$$\sigma^2 \sim \mathsf{InvGamma}, \quad \mu \mid \sigma^2 \sim \mathsf{Normal}$$

▶ With a bit change of notation, we define the prior as

$$\sigma^2 \sim \mathsf{InvGamma}\left(\frac{\nu_0}{2}, \frac{\nu_0 \sigma_0^2}{2}\right) \sim \mathsf{Scaled-Inv-}\chi^2(\nu_0, \sigma_0^2), \quad \mu \mid \sigma^2 \sim \mathcal{N}\left(\mu_0, \frac{\sigma^2}{\kappa_0}\right)$$

▶ We found the following combination most convenient:

$$\sigma^2 \sim \mathsf{InvGamma}, \quad \mu \mid \sigma^2 \sim \mathsf{Normal}$$

▶ With a bit change of notation, we define the prior as

$$\sigma^2 \sim \mathsf{InvGamma}\left(\frac{\nu_0}{2}, \frac{\nu_0 \sigma_0^2}{2}\right) \sim \mathsf{Scaled-Inv-}\chi^2(\nu_0, \sigma_0^2), \quad \mu \mid \sigma^2 \sim \mathcal{N}\left(\mu_0, \frac{\sigma^2}{\kappa_0}\right)$$

▶ This prior is called **Normal-Inverse-Gamma** distribution or **Normal-Inverse-** $\chi^2$  distribution with density:

$$p(\mu, \sigma^2) \propto (\sigma^2)^{-(\nu_0 + 3)/2} \exp\left\{-\frac{\nu_0 \sigma_0^2 + \kappa_0 (\mu - \mu_0)^2}{2\sigma^2}\right\}$$

 $\blacktriangleright \text{ N-Inv-Gamma}\left(\mu_0,\kappa_0,\tfrac{\nu_0}{2},\tfrac{\nu_0\sigma_0^2}{2}\right) \text{ or N-Inv-}\chi^2\left(\mu_0,\kappa_0,\nu_0,\sigma_0^2\right)$ 

▶ We found the following combination most convenient:

$$\sigma^2 \sim \text{InvGamma}, \quad \mu \mid \sigma^2 \sim \text{Normal}$$

With a bit change of notation, we define the prior as

$$\sigma^2 \sim \mathsf{InvGamma}\left(\frac{\nu_0}{2}, \frac{\nu_0 \sigma_0^2}{2}\right) \sim \mathsf{Scaled-Inv-}\chi^2(\nu_0, \sigma_0^2), \quad \mu \mid \sigma^2 \sim \mathcal{N}\left(\mu_0, \frac{\sigma^2}{\kappa_0}\right)$$

▶ This prior is called **Normal-Inverse-Gamma** distribution or **Normal-Inverse**- $\chi^2$ distribution with density:

$$p(\mu, \sigma^2) \propto (\sigma^2)^{-(\nu_0 + 3)/2} \exp\left\{-\frac{\nu_0 \sigma_0^2 + \kappa_0 (\mu - \mu_0)^2}{2\sigma^2}\right\}$$

- ▶ N-Inv-Gamma  $\left(\mu_0, \kappa_0, \frac{\nu_0}{2}, \frac{\nu_0\sigma_0^2}{2}\right)$  or N-Inv- $\chi^2\left(\mu_0, \kappa_0, \nu_0, \sigma_0^2\right)$
- ▶ The Jeffreys prior corresponds to  $\mu_0=0=\kappa=0=\nu=0=0=0$

The posterior is

$$p(\mu, \sigma^2 \mid y)$$

$$\propto (\sigma^2)^{-(\nu_0+n+3)/2} \exp\left\{-\frac{\nu_0\sigma_0^2 + (n-1)s^2 + \kappa_0(\mu-\mu_0)^2 + n(\mu-\bar{y})^2}{2\sigma^2}\right\}$$

$$\propto (\sigma^2)^{-(\nu_0+n+3)/2} \exp\left\{-\frac{\nu_0\sigma_0^2 + (n-1)s^2 + \frac{n\kappa_0}{n+\kappa_0}(\mu_0-\bar{y})^2 + (\kappa_0+n)\left(\mu - \frac{\kappa_0\mu_0 + n\bar{y}}{\kappa_0 + n}\right)^2}{2\sigma^2}\right\}$$

which is N-Inv-Gamma 
$$\left(\mu_0,\kappa_0,\frac{\nu_0}{2},\frac{\nu_0\sigma^2}{2}\right)$$
 with

 $\mu_n=rac{\kappa_0\mu_0+nar{y}}{\kappa_0+n}$ 

$$\kappa_0 + r$$

$$\kappa_n = \kappa_0 + n$$

$$\nu_n = \nu_0 + n$$

$$\nu_n\sigma_n^2=\nu_0\sigma_0^2+(n-1)s^2+\frac{n\kappa_0}{n+\kappa_0}(\mu_0-\bar{y})^2$$

$$p(\mu, \sigma^2 \mid y) \sim \text{N-Inv-}\Gamma\left(\frac{\kappa_0 \mu_0 + n\bar{y}}{\kappa_0 + n}, \kappa_0 + n, \frac{\nu_0 + n}{2}, \frac{\nu_0 \sigma_0^2 + (n-1)s^2 + \frac{n\kappa_0}{n + \kappa_0}(\mu_0 - \bar{y})^2}{2}\right)$$

Now recall our previous discussion on the marginal/conditional distributions.

$$p(\mu, \sigma^2 \mid y) \sim \text{N-Inv-}\Gamma\left(\frac{\kappa_0 \mu_0 + n\bar{y}}{\kappa_0 + n}, \kappa_0 + n, \frac{\nu_0 + n}{2}, \frac{\nu_0 \sigma_0^2 + (n-1)s^2 + \frac{n\kappa_0}{n + \kappa_0}(\mu_0 - \bar{y})^2}{2}\right)$$

- Now recall our previous discussion on the marginal/conditional distributions.
- ightharpoonup conditional posterior of  $\mu$ :

$$p(\mu \mid \sigma^2, y) \sim \mathcal{N}\left(\frac{\kappa_0 \mu_0 + n\bar{y}}{\kappa_0 + n}, \frac{\sigma^2}{\kappa_0 + n}\right)$$

$$p(\mu, \sigma^2 \mid y) \sim \text{N-Inv-}\Gamma\left(\frac{\kappa_0 \mu_0 + n\bar{y}}{\kappa_0 + n}, \kappa_0 + n, \frac{\nu_0 + n}{2}, \frac{\nu_0 \sigma_0^2 + (n-1)s^2 + \frac{n\kappa_0}{n + \kappa_0}(\mu_0 - \bar{y})^2}{2}\right)$$

- Now recall our previous discussion on the marginal/conditional distributions.
- $\triangleright$  conditional posterior of  $\mu$ :

$$p(\mu \mid \sigma^2, y) \sim \mathcal{N}\left(\frac{\kappa_0 \mu_0 + n\bar{y}}{\kappa_0 + n}, \frac{\sigma^2}{\kappa_0 + n}\right)$$

 $\triangleright$  conditional posterior of  $\sigma^2$ :

$$p(\sigma^2 \mid \mu, y) \sim \mathsf{Scaled\text{-}Inv-}\Gamma\left(\frac{\nu_0 + n + 1}{2}, \frac{\nu_0 \sigma_0^2 + (n - 1)s^2 + \kappa_0 (\mu - \mu_0)^2 + n(\mu - \bar{y})^2}{2}\right)$$

$$p(\mu, \sigma^2 \mid y) \sim \text{N-Inv-}\Gamma\left(\frac{\kappa_0 \mu_0 + n\bar{y}}{\kappa_0 + n}, \kappa_0 + n, \frac{\nu_0 + n}{2}, \frac{\nu_0 \sigma_0^2 + (n-1)s^2 + \frac{n\kappa_0}{n + \kappa_0}(\mu_0 - \bar{y})^2}{2}\right)$$

ightharpoonup marginal posterior of  $\sigma^2$ :

$$p(\sigma^2 \mid y) \sim \mathsf{Scaled-Inv-}\Gamma\left(\frac{\nu_0 + n}{2}, \frac{\nu_0\sigma_0^2 + (n-1)s^2 + \frac{n\kappa_0}{n + \kappa_0}(\mu_0 - \bar{y})^2}{2}\right)$$
